EDA (Week 3)

1. Hotel bookings and cancellations

```
In [7]:
         # The number of hotel reservations and cancellations can directly show the actual numbe
         import seaborn as sns
         plt.figure(figsize=(15,8))
         sns.countplot(x='hotel'
                       ,data=df
                       ,hue='is_canceled'
                       ,palette=sns.color_palette('Set2',2)
        <AxesSubplot:xlabel='hotel', ylabel='count'>
```

Out[7]:

#calculate the proportion of cancellations for each unique value in the 'hotel' column hotel_cancel=(df.loc[df['is_canceled']==1]['hotel'].value_counts()/df['hotel'].value_co print('Hotel cancellations'.center(20),hotel_cancel,sep='\n')

Hotel cancellations
City Hotel 0.417270
Resort Hotel 0.277634
Name: hotel, dtype: float64

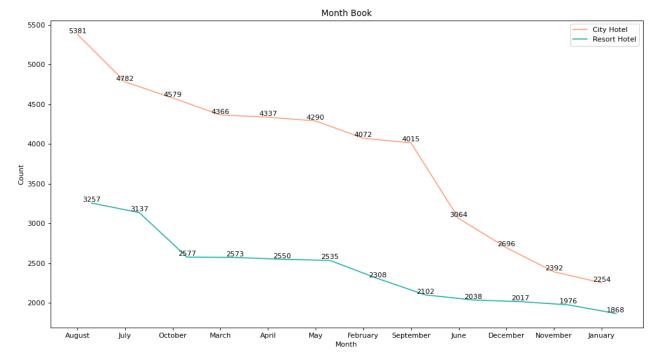

Comment: City Hotel's booking volume and cancellation volume are both higher than Resort Hotel's, but Resort Hotel's cancellation rate is 27.8%, while City Hotel's cancellation rate reaches 41.7%.

1. Hotel bookings by month

```
In [9]:
         #create a plot to visualize the number of bookings for "City Hotel" and "Resort Hotel"
         city_hotel=df[(df['hotel']=='City Hotel') & (df['is_canceled']==0)]
         resort_hotel=df[(df['hotel']=='Resort Hotel') & (df['is_canceled']==0)]
         for i in [city_hotel,resort_hotel]:
             i.index=range(i.shape[0])
         city_month=city_hotel['arrival_date_month'].value_counts()
         resort_month=resort_hotel['arrival_date_month'].value_counts()
         name=resort_month.index
         x=list(range(len(city_month.index)))
         y=city_month.values
         x1=[i+0.3 \text{ for } i \text{ in } x]
         y1=resort_month.values
         width=0.3
         plt.figure(figsize=(15,8),dpi=80)
         plt.plot(x,y,label='City Hotel',color='lightsalmon')
         plt.plot(x1,y1,label='Resort Hotel',color='lightseagreen')
         plt.xticks(x,name)
         plt.legend()
         plt.xlabel('Month')
```

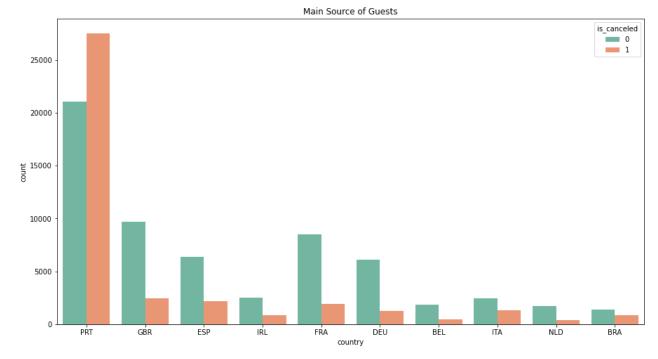

```
plt.ylabel('Count')
plt.title('Month Book')
for x,y in zip(x,y):
    plt.text(x,y+0.1,'%d' % y,ha = 'center',va = 'bottom')

for x,y in zip(x1,y1):
    plt.text(x,y+0.1,'%d' % y,ha = 'center',va = 'bottom')
```

Comment: Peak booking months are August and July. Preliminary judgment is that the long holiday caused the peak period.

1. Customer origin and booking cancellation rate

#calculate the cancellation rate for each of the top 10 countries (those with the higher country_cancel_rate=(country_cancel/country_book).sort_values(ascending=False)
print('Customer cancellation rates by country'.center(10),country_cancel_rate,sep='\n')

```
Customer cancellation rates by country
PRT
       0.566351
BRA
       0.373201
ITA
       0.353956
ESP
       0.254085
IRL
       0.246519
BEL
       0.202391
GBR
       0.202243
FRA
       0.185694
NLD
       0.183935
DEU
       0.167147
```

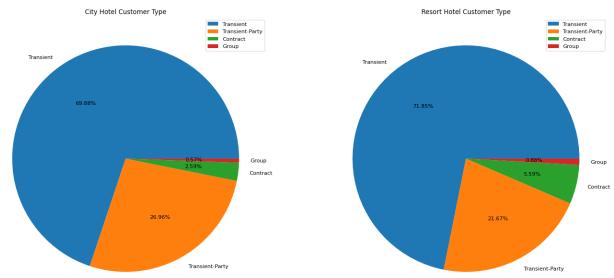

Name: country, dtype: float64

The peak season for both Resort hotel and City hotel is July and August in summer, and the main sources of tourists are European countries. This is in line with the characteristics of European tourists who prefer summer travel. It is necessary to focus on countries with high cancellation rates such as Portugal (PRT) and the United Kingdom (BRT). Main source of customers.

1. Customer type

```
In [12]: #visualize the distribution of customer types for two types of hotels: City Hotel and R
    city_customer=city_hotel.customer_type.value_counts()
    resort_customer=resort_hotel.customer_type.value_counts()
    plt.figure(figsize=(21,12),dpi=80)
    plt.subplot(1,2,1)
    plt.pie(city_customer,labels=city_customer.index,autopct='%.2f%%')
    plt.legend(loc=1)
    plt.title('City Hotel Customer Type')
    plt.subplot(1,2,2)
    plt.pie(resort_customer,labels=resort_customer.index,autopct='%.2f%%')
```

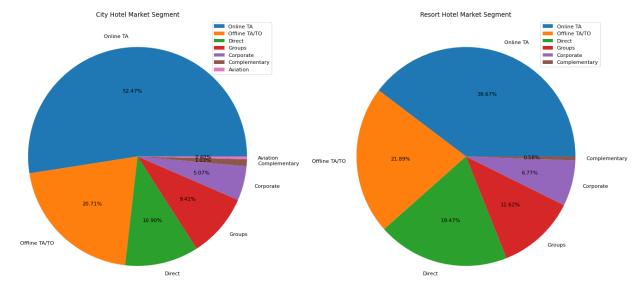

```
plt.title('Resort Hotel Customer Type')
plt.legend()
plt.show()
```

The main customer type of the hotel is transient travelers, accounting for about 70%.

1. Hotel booking method

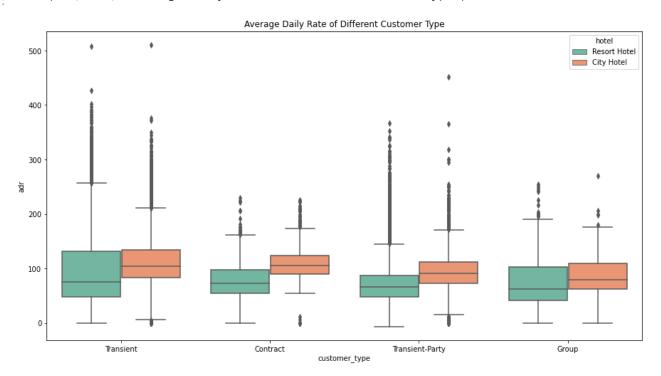

```
#create pie charts to visualize the distribution of market segments for both City Hotel
city_segment=city_hotel.market_segment.value_counts()
resort_segment=resort_hotel.market_segment.value_counts()
plt.figure(figsize=(21,12),dpi=80)
plt.subplot(1,2,1)
plt.pie(city_segment,labels=city_segment.index,autopct='%.2f%%')
plt.legend()
plt.title('City Hotel Market Segment')
plt.subplot(1,2,2)
plt.pie(resort_segment,labels=resort_segment.index,autopct='%.2f%%')
plt.title('Resort Hotel Market Segment')
plt.legend()
plt.show()
```

The customers of the two hotels mainly come from online travel agencies, which account for even more than 50% of the City Hotel; offline travel agencies come next, accounting for about 20%.

1. Average daily expenses of various types of passengers

Out[14]: Text(0.5, 1.0, 'Average Daily Rate of Different Customer Type')

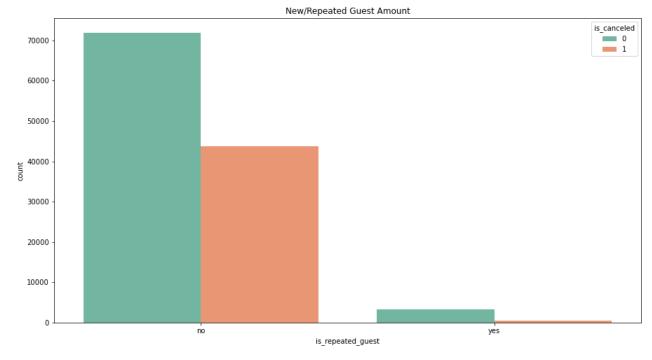

> The average daily expenditure of all types of customers of City Hotel is higher than that of Resort Hotel; among the four types of customers, the consumption of individual travelers (Transient) is the highest and that of group travelers (Group) is the lowest.

7. Number of new and old customers and cancellation rate

```
In [15]:
          # visualize the count of bookings, categorized by whether the guest is a repeated guest
          plt.figure(figsize=(15,8))
          sns.countplot(x='is_repeated_guest'
                         ,data=df
                         ,hue='is_canceled'
                        ,palette=sns.color_palette('Set2',2)
          plt.title('New/Repeated Guest Amount')
          plt.xticks(range(2),['no','yes'])
         ([<matplotlib.axis.XTick at 0x2168f567910>,
Out[15]:
           <matplotlib.axis.XTick at 0x2168f5678e0>],
```

[Text(0, 0, 'no'), Text(1, 0, 'yes')])

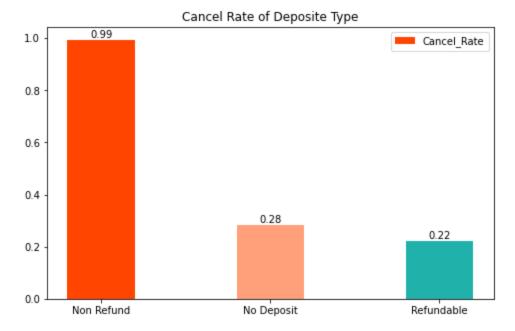

```
In [16]:
          #calculate and printing the cancellation rates for new and repeated guests
          guest_cancel=(df.loc[df['is_canceled']==1]['is_repeated_guest'].value_counts()/df['is_r
          guest_cancel.index=['New Guest', 'Repeated Guest']
          print('Cancellation rate for new and old customers'.center(15),guest_cancel,sep='\n')
```

```
Cancellation rate for new and old customers
New Guest
                  0.377851
                  0.144882
Repeated Guest
Name: is_repeated_guest, dtype: float64
```

The cancellation rate for regular customers was 14.4%, while the cancellation rate for new customers reached 37.8%, which was 24 percentage points higher than that for regular customers.

1. Deposit method and reservation cancellation rate

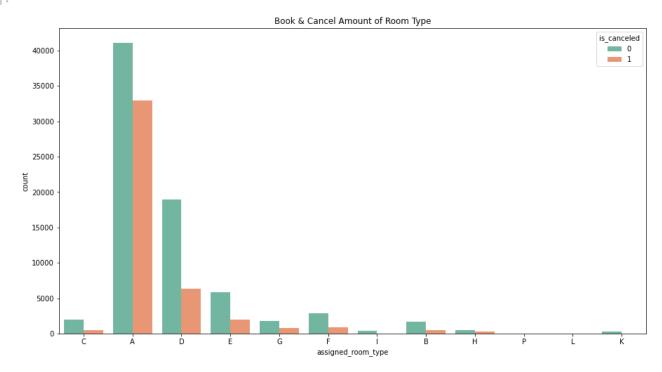

```
In [17]:
          print('Three deposit methods for booking quantity'.center(15),df['deposit_type'].value
         Three deposit methods for booking quantity
         No Deposit
                       104641
         Non Refund
                        14587
         Refundable
                          162
         Name: deposit_type, dtype: int64
In [18]:
          #calculate the cancellation rates based on the 'deposit_type', and visualizing these ra
          deposit_cancel=(df.loc[df['is_canceled']==1]['deposit_type'].value_counts()/df['deposit_
          plt.figure(figsize=(8,5))
          x=range(len(deposit_cancel.index))
          y=deposit_cancel.values
          plt.bar(x,y,label='Cancel_Rate',color=['orangered','lightsalmon','lightseagreen'],width
          plt.xticks(x,deposit_cancel.index)
          plt.legend()
          plt.title('Cancel Rate of Deposite Type')
          for x,y in zip(x,y):
              plt.text(x,y,'%.2f' % y,ha = 'center',va = 'bottom')
```

'No Deposit' is the method with the highest number of bookings and has a low cancellation rate, while the cancellation rate of non-refundable type is as high as 99%. This type of deposit method can be reduced to reduce Customer cancellation rate.

1. Room type and cancellation volume

Out[19]: Text(0.5, 1.0, 'Book & Cancel Amount of Room Type')

In [20]:

#calculate cancellation rates for the top 7 assigned room types and printing them in de
room_cancel=df.loc[df['is_canceled']==1]['assigned_room_type'].value_counts()[:7]/df['a
print('Cancellation rates for different room types'.center(5),room_cancel.sort_values(a

Cancellation rates for different room types

A 0.444925

G 0.305523

E 0.252114

D 0.251244

F 0.247134

B 0.236708

C 0.187789

Name: assigned_room_type, dtype: float64

Among the top seven room types with the most bookings, the cancellation rates of room types A and G are higher than other room types, and the cancellation rate of room type A is as high as 44.5%.

Conclusion

- 1. The booking volume and cancellation rate of City Hotel are much higher than that of Resort Hotel. The hotel should conduct customer surveys to gain an in-depth understanding of the factors that cause customers to give up on bookings in order to reduce customer cancellation rates.
- 2. Hotels should make good use of the peak tourist season of July and August every year. They can increase prices appropriately while ensuring service quality to obtain more profits, and conduct preferential activities during the off-season (winter), such as Christmas sales and New Year activities, to reduce Hotel vacancy rate.

3. Hotels need to analyze customer profiles from major source countries such as Portugal and the United Kingdom, understand the attribute tags, preferences and consumption characteristics of these customers, and launch exclusive services to reduce customer cancellation rates.

- 4. Since individual travelers are the main customer group of hotels and have high consumption levels, hotels can increase the promotion and marketing of independent travelers through online and offline travel agencies, thereby attracting more tourists of this type.
- 5. The cancellation rate of new customers is 24% higher than that of old customers. Therefore, hotels should focus on the booking and check-in experience of new customers, and provide more guidance and benefits to new customers, such as providing discounts to first-time customers and conducting research on new customers. Provide feedback on satisfaction and dissatisfaction with your stay to improve future services and maintain good old customers.
- 6. The cancellation rate of non-refundable deposits is as high as 99%. Hotels should optimize this method, such as returning 50% of the deposit, or cancel this method directly to increase the occupancy rate.
- 7. The cancellation rate of room types A and G is much higher than that of other room types. The hotel should carefully confirm the room information with the customer when making a reservation, so that the customer can fully understand the room situation, avoid cognitive errors, and at the same time be able to understand the room facilities. Optimize and improve service levels.

Data Processing (Week 4)

```

The reservation status ('reservation_status') has the highest correlation with whether to cancel the reservation, reaching 0.92, but considering that it may cause the model to overfit in the future, it is deleted; the deposit type ('deposit_type') reaches 0.47, creating a characteristic Whether the reservation and assigned room type are consistent ('same_assignment') also has a correlation of 0.25.
